

The Stream Receiver is a turnkey solution that allows broadcasters to receive a web radio stream that can then be played on a local sound system.

All you need to provide is power and an Internet connection.

Starts receiving immediately.

Galcom will program the web radio URL for you. There is no technical setup other than connecting the audio output.

If power or the Internet connection is intermittent, the stream will reconnect automatically.

The unit can be accessed remotely for updates and technical support.
